Influenza Surveillance Summary

Electronic Surveillance:
- The percent of outpatient encounters due to influenza-like illness (ILI) or pneumonia and influenza (P&I) continued to decrease and was below baseline in week 14 (30 March – 05 April 2014) for service members and dependents. ILI and P&I activity continued to decline among vaccinated and unvaccinated service members in week 14. For this season, among service members, the percent positive for lab tested samples is 6.2%. Among dependents, the percent positive for lab tested samples is 4.0%.

Laboratory Surveillance:
- Respiratory illness rates at all basic training centers are at or below expected values. There were no flu cases in week 14.
- For week 13 (23 March – 29 March 2014), there were 13 flu positive lab results for service members (1 A/H1, 5 A/H3, 5 A not subtyped, 2 B) and 21 for dependents (3 A/H1, 3 A/H3, 7 A not subtyped, 8 B). For week 14, there were 14 flu positive lab results for service members (2 A/H1, 3 A not subtyped, 9 B) and 14 for dependents (2 A/H1, 1 A/H3, 7 A not subtyped, 4 B) (Figure 1).
- For this season, among service members, the percent positive for lab tested samples is 6.2%. Among dependents, the percent positive for lab tested samples is 4.0%.

Southern Command

Electronic Surveillance:
- The percent of encounters that were ILI or P&I related remained low and was below baseline (Figure 4).

Laboratory Surveillance:
- Among local nationals in Peru in weeks 13 and 14, 15 samples were tested and 7 tested positive for flu (3 A/H1, 4 B).

Central Command

Electronic Surveillance:
- The percent of outpatient encounters due to ILI or P&I remained low in week 14 for service members and dependents and was at or below baseline.
- Among service members during week 14, ILI and P&I activity fluctuated but remained low compared to previous seasons.

Laboratory Surveillance:
- For week 14, there were 3 flu positive results for service members (1 A/H1, 2 A not subtyped) and 1 positive result for dependents (1 A not subtyped) (Figure 2).
- For this season, among service members, the percent positive for lab tested samples is 13.3%. Among dependents, the percent positive for lab tested samples is 8.0%.

Africa Command

Electronic Surveillance:
- There were no positive flu results among local nationals in Cameroon or Uganda in week 14.

Laboratory Surveillance:
- (None to report)

Pacific Command

Electronic Surveillance:
- The percent of outpatient encounters due to ILI or P&I remained stable and were at or below baseline in week 14 for service members and dependents.
- ILI and P&I activity remained stable in week 14.

Laboratory Surveillance:
- For week 13, there were 5 flu positive lab results for service members (2 A/H3, 3 A not subtyped) and 6 flu positive results for dependents (1 A/H3, 3 A not subtyped, 2 B). For week 14, there was 1 flu positive lab result for service members (1 A not subtyped) and 2 positive flu results reported for dependents (2 A not subtyped) (Figure 3).
- For this season, among service members, the percent positive for lab tested samples is 14.5%. Among dependents, the percent positive for lab tested samples is 9.5%.
- Among local nationals and embassy employees since 29 Sept 2013, 48 collection sites in 12 countries collected a total of 2226 specimens from patients with ILI symptoms. The majority of specimens were collected in Thailand (47.8%). As of 01 April 2014, of the 2142 specimens tested, 622 (29%) tested positive (166 A/H1, 151 A/H3, 304 Flu B, 1 A&B coinfection).

Figure 4. CENTCOM
Figure 4.a Percent of All TMDS Encounters with an ILI Diagnosis

Figure 4.b Percent of All Outpatient Visits with a P&I Diagnosis
Description:
Figures are stratified by Combatant Commands (COCOM). For NORTHCOM, EUCOM, and PACOM, several figures are presented. The first 5 figures present the weekly data on ILI and P&I events. These figures give an overview of the influenza season by incidence and all outpatient visits. This data can give a broad view of the pattern and severity of the season and allow the reader to compare seasonal patterns with previous years and between the U.S. and international regions. The last 2 figures present the Health Level 7 (HL-7) laboratory data for the DoD. These figures provides the number of influenza laboratory tests (influenza PCR or viral culture tests only) performed each week and the proportion and serotype of influenza positive tests.

Incidence of Influenza:
Each week the incidence rates of ILI and P&I are calculated for active component service members. The numerator comprises the sum of new events occurring during the week of interest. The denominator comprises the total number of persons at risk for that week. Rates are stratified by seasonal influenza vaccination status at the start of the week. Service members vaccinated against influenza at least 14 days prior to the start of the week are included in the vaccinated group. (Figure 1)

Percentage of Outpatient Visits Associated with Influenza:
The percentage of all outpatient visits that have an ILI or P&I diagnosis is calculated each week for (1) all service members, regardless of component and (2) all other DoD beneficiaries. Current proportions are graphed against the baseline** and data for the two prior influenza seasons for comparison.

Laboratory Tests for Influenza (HL-7):
Each week the total number of influenza laboratory tests (PCR or viral culture only) performed and the proportion and serotype of influenza positive tests is calculated for (1) all service members, regardless of component and (2) all other DoD beneficiaries.

CENTCOM Medical Encounters (Theater Medical Data Store -TMDS):
The percentage of all medical encounters reported in TMDS that have an ILI or P&I diagnosis is calculated each week for service members (regardless of component) deployed to CENTCOM. Current proportions are graphed against the baseline** and data for the two prior influenza seasons for comparison.

(All data are preliminary and subject to change as updated data is received)

Background:
AFHSC maintains the Defense Medical Surveillance System (DMSS) which is a database containing up-to-date and historical data on medical encounters, vaccinations, and personnel and demographic data about service members from all military services. Using ICD-9 codes from hospitalization and outpatient encounters, influenza vaccination data, and laboratory data contained within the DMSS, AFHSC produces weekly summaries of respiratory illness activity among military health system beneficiaries by COCOM. Two primary outcomes are used for this surveillance: Influenza-like Illness (ILI) and Pneumonia and Influenza (P&I). ILI is defined as a health care encounter that resulted in a diagnostic (ICD-9) code of 79.99, 382.9, 460, 461.9, 465.8, 465.9, 466.0, 486, 487.0, 487.1, 487.8, 488, 490, 780.6, or 786.2. P&I is defined as an ICD-9 code of 480-488.

**The COCOM specific baseline is the percentage of outpatient visits (or medical encounters for CENTCOM) for ILI or P&I during non-influenza weeks (weeks 22-39) over the past 3 years plus two standard deviations.
