There were 107 BCT classes during this 12-month period that included 27,703 men and 4,043 women. Figure 1 shows the injury incidence for the main injury types. The overall incidence for the BCT class was 6.5% (range: 0.3% - 43.8%) compared to 3.9% (range: 0.7% - 20.1%) for the Army. Table 1 shows that the incidence of injuries increased for men and women compared to the Army overall. The data also showed that the greatest amount of incidents occurred for those aged 20-29 years (range: 0-30%) and for the Basic Training Class (BCT) (range: 0-70%). This suggests that the data from this current study can be used to identify and prioritize strategies for injury prevention.

**Figure 1** Overall incidence and rate of injury (All): BCT Class (All). Overall incidence and rate of injury for the BCT class was 6.5% (range: 0.3% - 43.8%) compared to 3.9% (range: 0.7% - 20.1%) for the Army. The data also showed that the greatest amount of incidents occurred for those aged 20-29 years (range: 0-30%) and for the Basic Training Class (BCT) (range: 0-70%).

**Table 1** shows that the incidence of injuries increased for men and women compared to the Army overall. The data also showed that the greatest amount of incidents occurred for those aged 20-29 years (range: 0-30%) and for the Basic Training Class (BCT) (range: 0-70%).
